3B README

Owen Kang | Yulin Yu | Jiemi Niu

Target Audience

The value proposition of 3B is to help indoor climbers who want to quickly find useful beta, upload their own attempts, and receive AI-guided coaching so they can climb more confidently and improve over time.

Access & Setup

You can access the 3B Medium-Fi prototype through Figma using this link
The prototype should already be set up and ready for use.

Intended Device

3B is intended to run on mobile smartphone devices (iPhone/Android). This prototype was designed using a smartphone-sized frame.

For this medium-fi prototype, it is recommended that the user accesses the prototype via a desktop or laptop so clicking/tapping is easier during testing.

Context

3B is intended to be useful before, during, and after a climbing attempt at the gym.

Discover (Pre-climb)

3B helps users find a gym and route, then view community beta videos so they can plan how to approach the climb.

Coach (Post-attempt)

3B helps users upload an attempt and receive structured AI feedback, highlighting what to improve.

Improve (Over time)

3B supports repeated attempts on the same route by enabling comparison and progress-oriented insights, helping climbers build consistency.

Prototype Operation

General

Most of the features for our prototype works, but they are prewritten. You can click most of them(including the logo) but you can't actually watch the video.

Simple Task (Find Beta for a Route)

- Starting from the Home / Find Your Gym screen, tap the search bar and select a gym (or choose from the list).
- On the Gym Routes page, select a route from the list.
- On the Route Detail page, go to the Videos/Beta section.
- Tap a beta video card to view community beta for that route.
- Accomplish: User reaches beta videos for a specific route.

Moderate Task (Upload an Attempt and Receive AI Feedback)

- Starting from a Route Detail page, tap Upload Your Attempt.
- Proceed through the upload screen (video selection is simulated).
- Continue past the Analyzing / Processing screen.
- Review the AI Feedback / Coaching results (insights are pre-written).
- Accomplish: User sees AI feedback for their uploaded attempt.

Complex Task (Track Progress Over Time: Compare + Next Steps)

- Starting from a Route Detail page, upload an attempt (follow Moderate Task steps).
- Navigate to the Compare view (My Attempt vs Other).
- Review comparison metrics + AI insights.
- Locate the actionable next steps / improvement summary (pre-written).
- Accomplish: User compares attempts and receives a clear "what to do next time" coaching summary.

Limitations

- No real gym database or GPS: Nearby gyms and search results are simulated; not connected to live location or a backend.
- No real video upload / playback processing: The prototype represents upload and viewing as screens/states, but does not actually store or process videos.
- No real AI coaching model: AI feedback, technique detection, and comparisons are presented as designed outcomes, not generated from real pose tracking.
- Limited error handling: Only a few edge cases are represented (e.g., “no gym found”); real-world cases like bad uploads, low lighting, network errors, etc. are not covered.

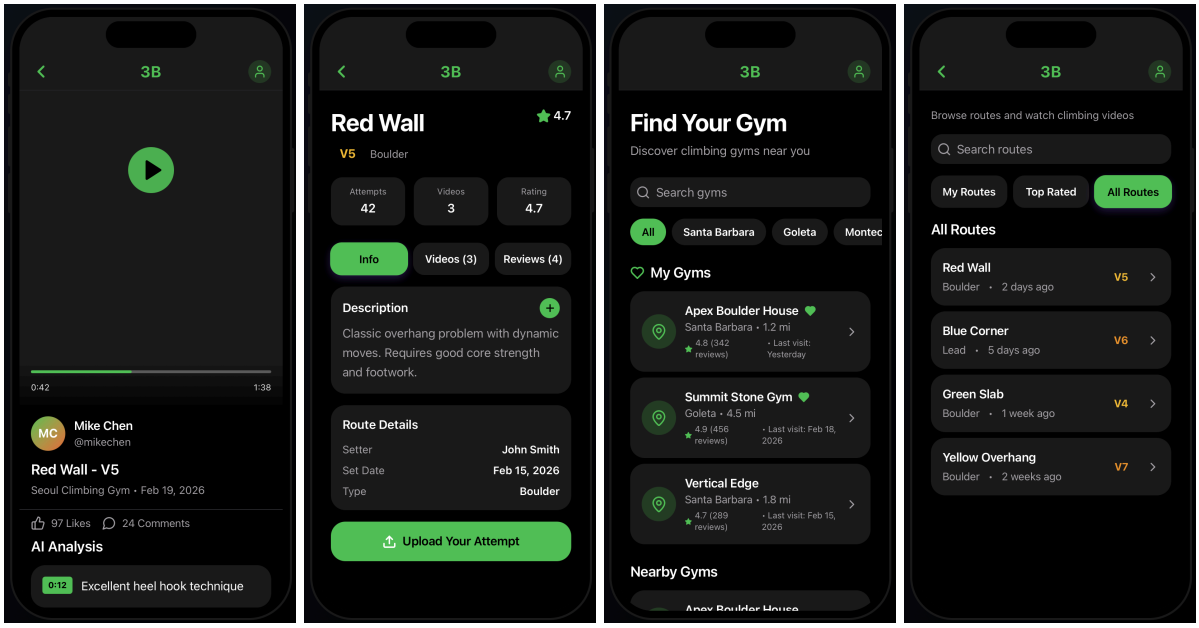
Wizard of Oz Techniques

- “Analyzing…” transition: A loading/processing screen implies AI computation before showing results.
- Personalization illusion: Profile attributes appear to influence advice, but feedback content is still prewritten.
- Compare experience: “My video vs other video” is dynamic, but the matching and scoring are simulated.

Hard-Coded Items

- Gyms list and search returns a fixed set of gyms; any other input can trigger the “no gym found” state.
- Routes per gym: Each gym has a fixed route list.
- Route content: Beta videos and reviews are pre-seeded and do not change.Upload outcome states: Upload always “succeeds” in the prototype and leads to a fixed analysis screen.
- AI feedback text and compare metrics: Coaching insights and comparison summaries suggestions are predetermined (not computed from the uploaded video).
- Profile data: Personal attributes, climbing style, and recent routes are static examples not auto-populated from use.

Images



Text are prewritten, and can’t play the video
